High-performance computing optimized node for scale-out workloads

PRIMERGY CX2550 M5
The Fujitsu Server PRIMERGY CX2550 M5 is the cost-effective system within the modular multi-node server offering that keeps pace with your growth and provides the flexibility to adapt to various high-performance and technical computing workloads. This dual-socket server node is equipped with the new 2nd generation of the Intel® Xeon® Processor Scalable Family that delivers high performance (up to 205W TDP), three UPI links per socket as well as a high core count of up to 28 cores per CPU. It allows the use of high memory bandwidth of up to 2933MT/s ideal for memory intensive HPC workloads. Moreover, both standard DDR4 memory modules as well as the new revolutionary Intel® Optane™ DC Persistent Memory can be used. Unlike traditional DRAM, the new persistent memory modules will offer the unprecedented combination of high-capacity, affordability and persistence. Servers equipped with this new class of memory will be able to adapt and optimize their workloads by moving and maintaining larger amounts of data closer to the processor and minimizing the higher latency of fetching data from system storage. In order to best meet the needs of HPC environments, in particular the requirement for high density, the node can be used with air cooling. The PRIMERGY CX400 M4 enclosure, in which the CX2550 M5 node is used, allows the sharing of power and cooling to reduce costs. The CX400 M4 is a modular 2U shared infrastructure chassis for up to four nodes with all the traditional data center attributes such as standard 19” racks, cabling and rear-aisle serviceability access.
