Reference Architecture for Commvault HyperScale™ X Software

Data Protection for Scale-Out Infrastructure

Data Protection Appliances

Data protection appliances and solutions from Fujitsu ensure data protection and 'always-on' availability across your hybrid cloud estate. Fujitsu specializes in mapping the right technology for individual needs depending on your business size spanning small, mid-size and enterprise-scale businesses. The solutions provide 24/7 business continuity, prevent cybercrime, and ensure compliance from on-premises to the cloud. Combining Fujitsu storage systems with leading partner technologies, we safeguard data and ensure always-on data integrity.

Reference Architecture for Commvault HyperScale™ X Software

The Reference Architecture for Commvault HyperScale™ X Software combines the benefits of the cloud like service, agility, resiliency, scalability with the advantages of on-premises backup storage especially if considering cost effects. Customers gain a fully tested, easy-to-set-up data protection solution for Commvault based on PRIMERGY Server to protect data in physical, virtual or cloud-based data centers.

The joint solution enables organizations to build a unified, modern data protection and management platform on a scale-out infrastructure. It delivers greater resiliency, availability, and scale with predictable performance and economics. Fujitsu collaborates with Commvault and offers Commvault Validated Reference Design to accelerate an organization's digital transformation journey as they move to hybrid cloud, container, and virtualized environments.

Key characteristics

Powerful Scale-Out Data Protection

- The Reference Architecture is the certified reference design for the Commvault HyperScale™ X Software based on industry-standard PRIMERGY Server.
- The tested and optimized solution simplifies ordering, installation, administration, and support. In addition, this helps enterprises match hardware configurations and capacity to their data protection needs, while accelerating ROI, reducing complexity and increasing customer value through a scale-out infrastructure.
- The validated hardware and the Commvault HyperScale™ X Software allow organizations to replace limited and legacy backup tools with a modern hybrid cloud-enabled data management solution that eliminates expensive forklift upgrades. You can build a unified, modern data protection and management platform for all workloads, including containers, virtual and databases delivering greater resiliency, agility, and investment protection.

PRIMERGY Server

- The Reference Architecture is based on the PRIMERGY RX2540 Server representing a suited platform for Commvault HyperScale™ X Software to expand and transform capabilities for customers in today's evolving software-defined world.
- PRIMERGY Server systems powered by latest Intel® Xeon® technology offer all the key components to accelerate innovation and provide a competitive advantage through business-proven quality, optimal efficiency and more agility for your daily operations. PRIMERGY servers deliver more than 25 years of development and production expertise resulting in extremely low failure rates below market average, and lead to continuous operations and outstanding hardware availability.
- The PRIMERGY RX Server systems are versatile rack-optimized servers providing best in-class performance and energy efficiency.
- The PRIMERGY RX2540 sets higher standards for usability, scalability and cost efficiency. The 2U dual-socket rack server is ideal for running enterprise applications, collaboration and messaging workloads as well as traditional databases. Moreover, it substantially simplifies carrying out infrastructure-related tasks like server virtualization and consolidation.

Commvault HyperScale™ X Software

- Commvault HyperScale™ X Software is a powerful, cloud-ready solution bringing scale-out infrastructure to the Commvault Intelligent Data Services platform. The unified, modern data protection and management platform delivers cloud-like services on-premises.
- The software consolidates all the roles performed by discrete servers in the traditional data protection architecture into a single software defined stack running on a scale-out infrastructure. It spans multiple storage nodes running on PRIMERGY RX Server, creating a massively addressable storage pool with built-in enterprise-class data management capabilities.
- All data management and storage optimization operations are distributed across the nodes, with each node capable of taking on multiple roles on demand, including moving data to cloud. Software defined resiliency and availability allows enterprises to fix failed components or nodes and replace or upgrade nodes seamlessly without disrupting operations or data availability.
- This simplified approach provides unmatched scalability, security, and resiliency to accelerate an organization's digital transformation journey as they move to hybrid cloud, container, and virtualized environments.

Components of the Reference Architecture

- The initial configuration of the Reference Architecture consists of three nodes, known as a block, each of the nodes being a PRIMERGY server (model N12) or a PRIMERGY server with a Direct Attached Storage Subsystem JX40 (model N24). Subsequent expansion of the Storage Pool can be done with individual or multiple nodes providing high scalability into petabytes of data.
- The server core components like chassis, CPU, memory, controller represent features of the Reference Architecture that do not change.
- Boot storage houses the operating system and core Commvault HyperScale X binaries. The metadata storage provides caching areas for such operations as deduplication, indexing, and extents. Boot and metadata can be configured either combined as a single storage unit or housed separately.
- Data storage houses the data footprint for the customer environment. There are several disk capacities to configure the required data storage, but use identical hard disk drive (HDD) capacities for each node.
- Networking needs a minimum of one port for data and one for storage communication between the nodes. The recommendation is to use four ports for failover and redundancy. Optional network cards with SAS or Fibre Channel interface for tape integration or Commvault IntelliSnap® operations are validated and customizable.

Technical details

General Specification

Model	N12	N24
Capacity	432 TB - 5 PB	
Capacity (net usable per node)	74, 87, 99, 111, 124 TiB	149, 174, 198, 223, 248 TiB
Capacity note	Initial configuration requires 3 nodes Upgrades with one or multiple nodes; node always fully populated with identical HDD capacities; capacity depending on used HDDs; capacity values calculated using Base2 (i.e., 1 TB = 1,099,511,627,776 bytes)	
Supported backup and archiving software for open systems	Commvault HyperScale™ X Software Commvault Intelligent Data Services Platform Software	
Supported Environments	Physical, virtual and NAS / NDMP systems	
Note	Use of accompanying and/or additional Software is subject to proactive acceptance of the respective License Agreements /EULAs/ Subscription and support terms of the Software manufacturer as applicable for the relevant Software whether preinstalled or optional. The software may only be available bundled with a software support subscription which – depending on the Software - may be subject to separate remuneration.	

Components

Base unit	PRIMERGY RX2540 M7 12x 3.5' w/ Expander
Product Type	Dual Socket Rack Server
	<p>If and to the extent a list of components or certain compatibilities are specified in the product data sheet, these component lists and compatibility specifications are exhaustive. Using deviating or other system components and applications together with the product may but does not necessarily have to lead to compatibility problems. A final statement and/or commitment on the compatibility of such deviating or other system components and applications can only be provided after a corresponding verification through a dedicated compatibility testing.</p> <p>The properties of the product provide a baseline for product security and therefore end-customer IT security. However, these properties are not sufficient on their own to protect the product from all existing threats, such as intrusion attempts, data exfiltration and other forms of cyberattacks. To customize security settings, please use the configuration options as available for the respective product. During operation, the IT security of this product is within the responsibility of the respective administrator/end-user of the product. Please note, that Fsas Technologies Inc. as a manufacturer does not make any policy prescriptions or advocacy statements regarding IT security best practices and/or general product operation.</p>
