

Datasheet

FUJITSU Software BS2000 COBOL2000 V1.6

COBOL Compiler

SHORT DESCRIPTION

COBOL compiler for the operating system FUJITSU Software BS2000 OSD/BC for object-oriented programming with the main functions of the COBOL2002 standard.

COBOL2000 (Common Business Oriented Language for OSD/BC) is a high-level, object-oriented programming language. COBOL is by far the most commonly used programming language worldwide for solving commercial data processing tasks.

The strength of COBOL lies in its efficient processing and manipulation of extensive data resources. COBOL notation is modeled on natural English language, so COBOL programs are easy to read and understand, even when written by other programmers.

Features and benefits

Main features	Benefits
COBOL2002 Standard <ul style="list-style-type: none">■ COBOL2000 elements are available	<ul style="list-style-type: none">■ Object-oriented programming
Funktionalität <ul style="list-style-type: none">■ Shared use of generated objects■ Exception Handling	<ul style="list-style-type: none">■ Reduction of memory requirements and load calls■ Effective handling of program-specific error situations
Compatibility <ul style="list-style-type: none">■ Upward compatible with COBOL85	<ul style="list-style-type: none">■ COBOL85 programs are still running
Extended control options <ul style="list-style-type: none">■ For translation and program flow■ For communication and data exchange with other programs	<ul style="list-style-type: none">■ Easy programming■ Support in creating software of high quality, productivity and security
Integration <ul style="list-style-type: none">■ Support of POSIX functionality	<ul style="list-style-type: none">■ Simultaneous use of POSIX and OSD/BC files

Topic

Product Characteristic

The implementation of the international standard is being taken another step forward in COBOL2000 V1.6. Beside the functional range of the previous versions COBOL2000 V1.4 and V1.5 beginning with this version will offer the complete processing (reading and writing) of XML-Documents from this version.

The product CRTE V10.0 or higher will be used as the runtime system for COBOL2000 V1.6.

Object-oriented techniques have become established in programming languages such as C++ and Java, and are now making inroads into the COBOL language. Conforming to the COBOL2002 standard, Fujitsu Technology Solutions COBOL compiler COBOL2000 provides elements (classes, interfaces, methods, inheritance, polymorphism) for programming with the new paradigm. Method calls and classical subroutine calls can now be programmed recursively. Exception handling offers an effective means of responding to error situations on a program-specific basis. A Repository supports the management of the interfaces between the individual programs and permits conformance checks. Needless to say, COBOL2000 provides full upward compatibility with COBOL85. As well as the functionality for programming in the OO paradigm, the new COBOL compiler also provides greatly extended options for control of compilation and program execution, for communication and for data exchange with other programs. These systematically improved and extended features are primarily responsible for making life easier for BS2000 customers when programming in the COBOL language and effectively support them in producing top-quality software at high levels of productivity and reliability.

POSIX extensions:

COBOL2000 supports the POSIX functionality and the POSIX file system in BS2000/OSD.

The COBOL2000 compiler is available in the following selectable units:

COBOL2000 full configuration:
 Compiler without runtime system
 with AID support
 with POSIX/XPG4 support
 with UDS-DML (native UDS support)
 with Report Writer

COBOL2000-BC basic configuration variant:
 Compiler without runtime system
 without AID support
 without POSIX/XPG4 support
 without UDS-DML (native UDS support)
 without Report Writer
 without Starter phase

CRTE is the common runtime environment for COBOL85, COBOL2000 and C/C++.

CRTE V10.0 is a software requirement for use of the COBOL2000 V1.6 compiler and for running COBOL2000 V1.6 applications.

CRTE is not supplied together with the COBOL2000 compiler but must be ordered separately for business servers. CRTE V10.0 is released for business servers starting from operating system version OSD/BC V10.0.

CRTE is already part of the corresponding operating system package OSD/XC for business servers of the SE series and therefore no separate order is required. In detail, CRTE V10.0 is a part of OSD/XC V10.0 for business server of the SE series.

COBOL2000 supports the symbolic debugging of COBOL programs with the AID interactive debugger (not with COBOL2000-BC). AID version V3.4 is required for debugging COBOL applications generated with COBOL2000 V1.6.

Functional Description

Enhancements in COBOL2000 compared to COBOL85

- Support of data type NATIONAL in order to display characters in the character set Unicode UTF-16
- user-defined types in tables
- data fields and data file sets with length 0
- Optimization of SORT-calls
- Usage parallel installed compiler versions
- Support for parameterized classes and parameterized interfaces as part of object-oriented programming according to the COBOL2000 standard
- Extension of the functionality by user-defined types (TYPE and TYPDEF clause).
- Extension of the functionality with the ALLOCATE and FREE statements for reserving and releasing dynamic memory
- Basic exception handling functions
- TURN directive for controlling exception handling
- Language elements for handling exception statuses in USE procedures
- RAISE and RESUME statements
- EXCEPTION-STATUS function for querying the last exception status
- Extension of the SET statement
- Extension of the INITIALIZE statement by the VALUE clause
- Compiler directives
- Extension of compiler control with the CALL-CONVENTION, IMP and TURN directives
- Support for free-format coding
- Extension of the classical program text area to the entire line. The program text may be written freely on a line up to a length of 248 characters.
- VERDI list, condensed source code listing with addresses, lengths and cross-references
- PROGRAM POINTER, new language element
- Extensions to the object-oriented language elements

- IMPLEMENTS clause,
- ACTIVE-CLASS and Object view as parameter
- Interface definitions of the BASE system class (BASEINTERFACE, BASEFACTORYINTERFACE)
- Support for additional BS2000 SORT functionality (XHCS, SORT-CCSN, sort sequence control option)
- Support for 31-character names
- Optional PICTURE clause
- Conditional compilation functionality conforming to COBOL2002 standard.
- XS capability of the compiler
- Garbage collection for OO objects if storage bottlenecks occur during the instantiation of new objects
- ANY LENGTH clause for formal parameters in methods
- Overwrite option in the NEW method for special object-specific initializations
- Support for files in objects
- Support for hexadecimal literals
- Numeric data fields extended from 18 to 31 decimal places
- Extensions to the INITIALIZE statement
- READ PREVIOUS for access to indexed and relative files
- Extensions to the compiler directives for controlling conditional compilations
- Exit from Outline Perform procedures (EXIT PARAGRAPH statement)

Extensions in version V1.5

Language tools to process XML-documents:

- provisioning of XML-documents
- Uses from XML-language-tools in programs
- binding, loading and starting of programs with XML-language features
- recognition of character sets, which are used for the presentation of XML-documents
- provisioning of the XML-parser
- expanded I/O-status for XML-commands

Extension in version V1.6

Language tools to create XML-documents:

- provisioning of the XML generator

Product Description

The COBOL2000 development system consists of the COBOL2000 compiler and the Common Runtime Environment CRTE. CRTE is the common runtime environment for COBOL2000, COBOL85 and C/C++. The COBOL source program is input to the COBOL2000 compiler via files, via SYSDTA, via program libraries (PLAM) or from the POSIX file system. The output from the compiler is an object module or LLM and compilation listings.

The object modules are output to the temporary module file (OMF), to program libraries (PLAM) or to the POSIX file system. The object modules resulting from one or more independent compilation runs must be linked together with CRTE to form a load module. A PLAM library is also used for input and output of repository data. The generated /390 format guarantees module compatibility for running BS2000 customer applications even through future architectural changes.

The compilation is controlled via the SDF interface, by COMOPT control options or from the POSIX shell. Error messages are output in English or German.

A syntax and semantic check on a COBOL program can be performed by starting a compiler run without code generation. Objects generated by COBOL2000 can be shared. This means a reduction in storage space and load calls.

Objects generated by COBOL2000 can be run above the 16 MB address space level.

The COBOL2000 applications can make use of an address space of up to 2 GB.

A COBOL program can process files with different organizational structures. The form of organization selected by the user determines the access method used by the file management system.

COBOL2000 supports the POSIX functionality and the POSIX file system in OSD/BC. OSD/BC and POSIX files can be processed simultaneously in a COBOL program.

Programs can be linked with other COBOL2000 or COBOL85 programs or with C/C++, Fortran, Pascal, PL/I, RPG3 and Assemble programs via the language-interfacing component of the CRTE (Common Run-Time Environment).

Communication with other COBOL programs and with the operating system is made possible by user and task switches, job variables, command line parameters and shell variables.

If required, symbol information for symbolic interactive debugging with AID can be generated with the full configuration variant of COBOL2000.

Language enhancements compared to COBOL Standard 1985 and aged language elements can be marked with special hints. Statements to the UDS/SQL database system can be integrated into COBOL programs using the COBOL DML (Data Manipulation Language).

The ESQL-COBOL precompiler (separate software) implements the COBOL program interface to the SESAM/SQL database systems via embedded SQL. This enables SQL functions to be invoked directly from within COBOL programs.

Technical Details

Requirements

Technical Requirements Hardware	BS2000 Business Server
Technical Requirements Software	OSD/BC V10.0 or higher OSD/XC V10.0 or higher CRTE V10.0B or higher Optional software required if the corresponding functionality is used: AID V3.4 or higher, for symbolic debugging In order to use the POSIX functionality, the POSIX-BC subsystem of the relevant OSD/XC version must be installed and loaded. UDS/SQL V2.5 or higher, if corresponding language elements are used; FIND Format7 features may require a correspondingly later UDS/SQL version UTM V5.2 or higher if COBOL modules are to be run as UTM program units. SORT V7.8 or higher. JV V14.0 or higher if corresponding language elements are used. LMS V3.3 or higher if LINE-SEQUENTIAL I/O is to be used with LMS files. NetExpress (Micro Focus) V3.1 or higher with NetExpress OSD/BC option, as a Windows NT-based development environment.
User Requirements	Knowledge of BS2000

Installation

Betriebsart	Batch and interactive dialog
Implementation Language	C/C++, COBOL, SPL4 and Assembler
User Interface	Commands in English Messages in English or German
Installation	Please refer to the relevant release notices.

Documentation and Training

Documentation	Language reference manual for COBOL2000 User guide for the COBOL2000 compiler User guide for CRTE User guide on AID debugging for COBOL2000 The documentation is available as online manuals, see http://manuals.ts.fujitsu.com/mainframes.html , or in printed form which must be paid for and ordered separately at http://manuals.ts.fujitsu.com .
Training	See course offer

Bezug und Lieferung

Conditions	This software product is supplied to the customer against a single payment or installments in accordance with our conditions for the use of software products.
Order and Delivery	This software product may be obtained from your local Fujitsu Technology Solutions GmbH regional office.

More information

Fujitsu products, solutions & services

In addition to BS2000, Fujitsu offers a full portfolio of other computing products.

Products

www.fujitsu.com/global/products/

Computing products

- Storage systems: ETERNUS
- Server: PRIMERGY, PRIMEQUEST, Fujitsu SPARC M10, BS2000/OSD Mainframe
- Client Computing Devices: LIFEBOOK, STYLISTIC, ESPRIMO, FUTRO, CELSIUS
- Peripherals: Fujitsu Displays, Accessories
- Software
- Network

Product Support Services with different service levels agreements are recommended to safeguard each product and ensure smooth IT operation.

Solutions

<http://www.fujitsu.com/global/solutions>

The Fujitsu solutions combine reliable Fujitsu products with the best in services, know-how and worldwide partnerships. Fujitsu's Solutions include parts of one or more activity groups (e.g., planning, implementation, support, management, and training services) and are designed to solve a specific business need.

Infrastructure Solutions are customer offerings created by bringing Fujitsu's best products, services and technologies together with those from partners to deliver benefit to our customers' businesses.

Industry Solutions are tailored to meet the needs of specific verticals.

Business and Technology Solutions provide a variety of technologies developed to tackle specific business issues such as security and sustainability, across many verticals.

Services

www.fujitsu.com/global/services/

Several customizable Fujitsu Service offerings ensure that IT makes a real difference and delivers true business value. We do this by leveraging our extensive experience in managing large, complex, transformational IT programs to help clients in planning, delivering and operating IT services in a challenging and changing business environment.

Application Services support the development, integration, testing, deployment and on-going management of both custom developed and packaged applications. The services focus on delivering business and productivity improvements for organizations.

Business Services respond to the challenge of planning, delivering and operating IT in a complex and changing IT environment.

Managed Infrastructure Services enable customers to deliver the optimal IT environment to meet their needs – achieving high levels of IT service quality and performance for data center and end user environments.

Fujitsu green policy innovation

www.fujitsu.com/global/about/environment/

Fujitsu Green Policy Innovation is our worldwide project for reducing burdens on the environment. Using our global know-how, we aim to resolve issues of environmental energy efficiency through IT. Please find further information at:
