

Start chatting with your data – with your own, trusted GPT Data-sovereign, on-premises LLM with Fsas Technologies

Generative AI is changing the way organizations operate, offering unprecedented advantages in efficiency, creativity, and decision-making. Amidst this digital revolution, data sovereignty remains non-negotiable. On-premise solutions allow organizations to leverage the full power of GenAI and Large Language Models without compromising data security and compliance.

While solutions like ChatGPT use vast, uncontrollable datasets and offer little, if any, privacy protection, on-premises Large Language Model (LLM) instances enable organizations to harness their own data's potential without

- data clutter from unknown sources
- sacrificing security, and
- violating privacy regulations.

But what exactly is an LLM instance? Essentially, it is a sophisticated deeplearning AI model, designed to understand, interpret, and generate human-like text. When deployed on premises, it provides a secure environment in which an organization's data can be processed, analyzed, and explored while keeping all sensitive information within the organization's control.

Large Language Models with Fsas Technologies

A pioneer of AI technologies from the start, we orchestrate an ecosystem of AI superpowers including AI consultancy, technology, managed service providers and system integrators, and local IT partners.

This allows us **to support your entire generative-AI and LLM journey** – from use case definition to secure implementation.

Another key advantage of on-premise deployment is its extreme level of customization and control. Organizations decide which data are utilized, ensuring relevance and accuracy. Outdated data can be removed and replaced at all times. And since AI solutions are containerized, individual departments within an organization can operate independent, sovereign LLM instances.

Streamlining AI integration with Fsas Technologies:

Comprehensive support from concept to completion

Our offering covers each step of your AI journey, from consultancy to design, implementation, testing, deployment, and ongoing support. We make sure that we thoroughly understand your data and requirements before leveraging our powerful partner ecosystem to build solutions that are truly end-to-end and tailored to empower your business.

Fsas Private GPT: your own, trusted GenAI

Our private GPT solution builds your LLM instances from the ground up, including the entire software and hardware stack for an on-prem GPT solution, optimized for your data and use cases, and powered by the Fsas Technologies ecosystem:

100% data sovereign on the user level

Retrieval Augmented Generation (RAG)

User-based databases for LLM

Testing on our 100% data-sovereign test drives (located in Germany, UK, and Italy)

Live deployments and proof-of-concepts on-prem or co-located

Pay per month without limits

No training or tuning of the LLM required

Our reference architecture for validated LLM models ensures continuous improvement and valuable insights.

Various open-source and closed-source models

Available on-premises and as consumption-based uSCALE of fering

Runs on PRIMERGY servers

Benefits

Knowledge management Easily access and safeguard your company's valuable knowledge

Data securityKeep your sensitive data stored safely inhouse

Avoid data overload Let your LLM extract valuable insights from your data, saving you from cutting through data clutter

Compliance
Stay aligned with data protection regulations effortlessly

Integration with existing systems
Our experts will ensure that the AI solution integrates seamlessly with your legacy systems

Take the first step into a new world where your data literally chats with you.
