

Go new ways
without risk

The backup is the final insurance to secure data availability. And in this sense, it is a vital element to maximize business continuity. A rule known as **3-2-1** approach provides a simple solution. This method means to keep

- **three** copies of data,
- on **two** different types of storage media,
- with **one** copy being laid away in a remote location.

Today's approach is often to have one copy in the cloud and another one on-premise. That brings the challenge if the interface is not talking the same language.

We as Fujitsu support you.

You don't need to change any equipment, just go two different ways in parallel.

It's never been so easy:

- ① Just write one backup-to-the-cloud and
- ② Write another backup-on-prem to one of the models of the ETERNUS CS8000 data protection family with the S3-cloud-interface

By this you can simply reduce CAPEX on one hand, while taking advantage of the best data protection appliance in the market:

- ✓ Immutability of data – by design
- ✓ Highest availability – up to synchronous mirroring

The ETERNUS CS8000 is the most reliable backup target you can imagine. It provides the fastest backup and restore performance in the market – up to 150 TB/h.

You can store data from various sources, such as websites, applications, or file systems. You can store them in S3 buckets securely and efficiently, preventing changes, and retrieve it when needed.

This is tested and validated for the leading backup applications from COMMVAULT, VEEAM and VERITAS.

It's time to relax and know your data safe!
